

## **Procedure for updating FIORI app**

As SSL certificate has been installed for the company's website [mptransco.in](http://mptransco.in) as well as for the ERP portals for security purpose, it is mandatory to replace 'http' with 'https' in the respective URLs for opening the web portals. In this context, the SAP Fiori Client app for mobile phones also needs to be updated. The procedure for updating the app is given below:

1. Open the SAP Fiori Client app in your mobile phone.
2. On the upper right corner of the app, tap on the 3 dots and choose **Settings**.
3. In the settings page, scroll down and choose the option **Clear all application settings**.
4. A notification window is open for choosing option Yes or No. By choosing option Yes the application settings will reset, allowing the user to change / update the URL in the address bar.
5. In the address bar please replace http with https, keeping the remaining contents unchanged.
6. Set or disable passcode as desired. If the passcode is set, the app would ask for the passcode every time the app is opened, followed by the ESS User-ID and Password. If the passcode is disabled, the app is opened without passcode and would only ask for the ESS User-ID and Password.

### **Fresh Installation of Sap Fiori Client App**

7. In the case of a fresh installation of the app on your mobile phone, the QR Code displayed below may be scanned to update the required URL. However, step 6 above would remain the same for setting up or disabling the passcode as desired.
